für Luft- und Raumfahrt e.V.

3d Mapping Motivation

- Subset of the well-known *Simultaneous Localization and Mapping* (SLAM) problem
- Mobile platform with 4 Time-of-Flight (ToF) cameras
 - Compact design and reasonably priced
 - Distance and intensity images in video frame rate
 - Irrespective of textures and illumination
 - **Erroneous data**

Outline

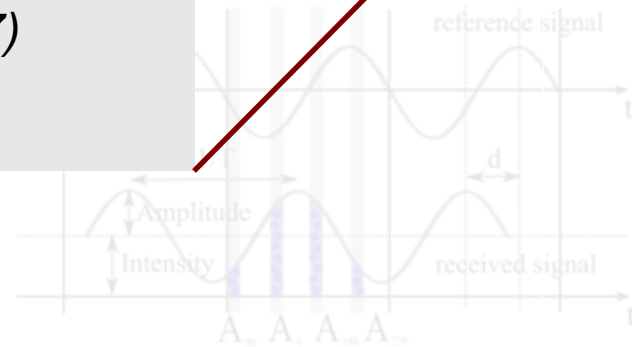

- ToF camera principle and error model
- 3d mapping process
 - Calibration
 - Filtering
 - ICP with frustum culling
 - Error relaxation
- Experimental results
- Contributions

ToF Camera Measurement Principle

Systematic ToF Camera Errors

- Distance-related error
- Fixed-Pattern-Phase-Noise (FPPN)
- Amplitude-related error
- Tackled by depth calibration
(cf. Fuchs and May, DAGM Dyn3d 2007)
(cf. Fuchs and Hirzinger, CVPR 2008)

Flying Pixels, Ambiguity and Noise

- Flying pixels at shape transitions, especially at jump edges

- Limited unambiguousness range, e.g. 7500 mm
- More distant objects appear $X \bmod 7500 \text{ mm}$

- Various noise sources (dark current, photocharge conversion noise, quantization noise etc.)

noisy measurements on a calibration plane

Multipath Interference and Light Scattering

➤ Light scattering

- Multipath interference
- Emitted light is also reflected by the objects within the scene
- Received signal is distorted, because it is a composition of directly and multiple reflected light

ToF Camera Errors – Isolation and Minimization

The image is a collage illustrating ToF camera errors. It features several key elements:

- 3D Point Cloud:** A green wireframe mesh of a chair. Three red circles with orange question marks are overlaid on the mesh, and the word "Filtering" is written in green across three of these circles.
- Camera Diagram:** A schematic of a camera sensor. It shows "incident light" entering from the left, hitting a sensor array. The word "Calibration" is written in green across three red circles overlaid on the diagram.
- Graph:** A plot of Power (P) versus time (t). It shows a "reference signal" (a sine wave) and a "received signal" (a sine wave with a phase shift). The phase shift is labeled as d . The frequency is labeled as $f = 1/T$. The amplitude is labeled as "Amplitude" and the intensity as "Intensity". The received signal is sampled at four points: A_{90} , A_0 , A_{180} , and A_{270} .

3d Mapping Process - Overview

ToF Camera Calibration

Preparation
Frame-wise
Post-processing

Calibration

- Pinhole camera calibration procedure
(cf. Strobl and Hirzinger, ICRA 2008)

Undistorting

- Estimation of ToF camera specific parameters
(cf. Fuchs and May, DAGM Dyn3D 2007)
- Undistortion and correction of the incoming images
(cf. Fuchs and Hirzinger, CVPR 2008)

Filtering

Registration

Global Error
Relaxation

Refinement

Filtering Noisy Data and Ambiguities

- Amplitude filtering
- Distant dependent threshold
- Filters low amplitudes from
 - Objects with low infrared reflectivity
 - Objects in larger distances to the camera

Preparation
Frame-wise
Post-processing

Calibration

Undistorting

Filtering

Registration

Global Error

Relaxation

Refinement

Filtering Jump Edges

- Computing „Neighborhood angle“ as a threshold for rejecting measurements (cf. *Fuchs and May, DAGM Dyn3D 2007*)

„Neighborhood angle“

$$\xi_i = \max \arcsin \frac{\| \mathbf{p}_{i,n} \|}{\| \mathbf{p}_{i,n} - \mathbf{p}_i \|} \sin \varphi$$

Preparation
Frame-wise
Post-processing

Calibration

Undistorting

Filtering

Registration

Global Error

Relaxation

Refinement

Registration

- Consecutive point clouds are registered by ICP algorithm
- Accumulation of ego motion
- Actual point clouds can be localized with respect to the first measurement
- Standard („Vanilla“) ICP assumes full coverage of **scene** and **model**
- Due to camera movement:
 - non-overlapping areas induce wrong point assignments

Registration – Frustum Culling

- Non-parametric and fast test
- Uses the intersection of both frustums
- Embedded in the iteration process
 - A priori pose estimation in each iteration is used for computation of frustum intersection
 - Discard point outliers

Preparation

Only the red points lay within the frustum intersection

Experiments

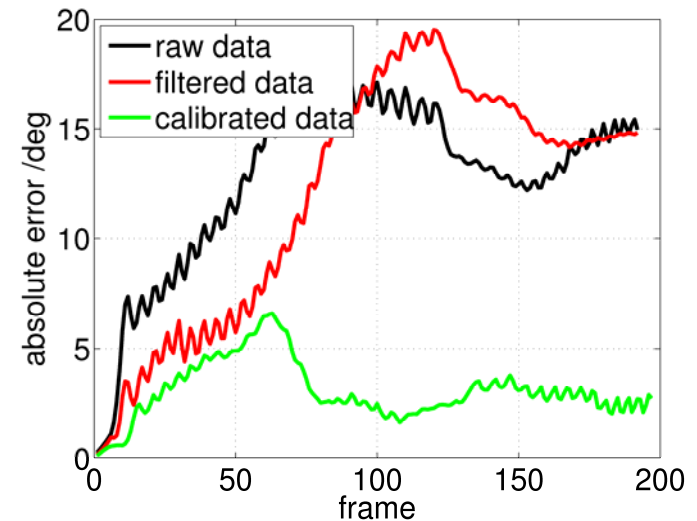

- Demonstrating
 - robustness,
 - achievable accuracy and
 - impact of error sources
- Accuracy of 3d mapping by comparing
 - estimated ego motion or
 - created 3d mapwith an appropriate ground truth
- Ground truth is given by
 - Odometry of an industrial robot
 - Manually measured significant scene features

- Swissranger SR 3100
- CMOS/CCD
 - 176x144 pixel
 - Aperture: 40° / 47°

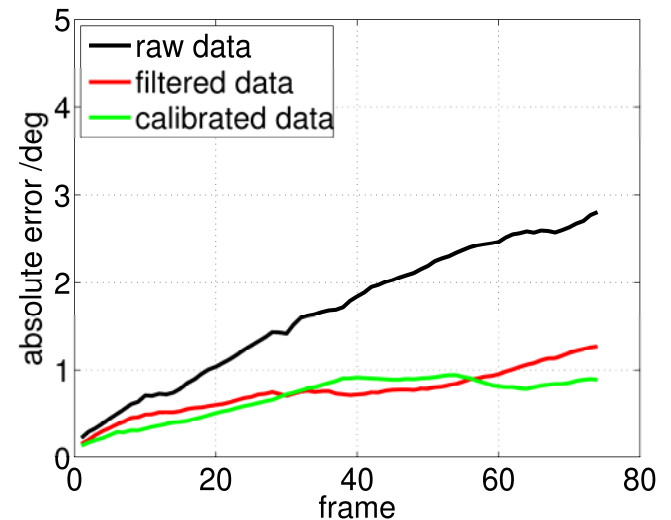

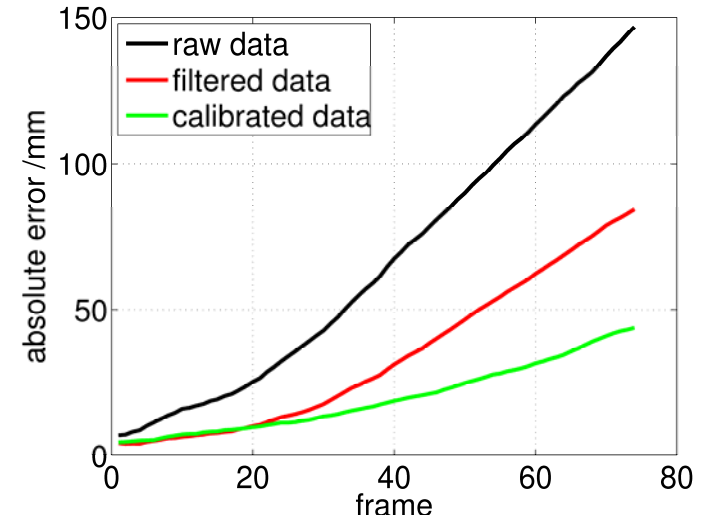

Results – Impact of Filtering and Calibration I

- Simple trajectory:
rotation at x-axis of camera by 90°
- Path length: 950 mm
- Translational error is reduced
by $> 50\%$ from 150 mm to 25 mm
- Rotational error is reduced
by $> 50\%$ from 15° to 3°

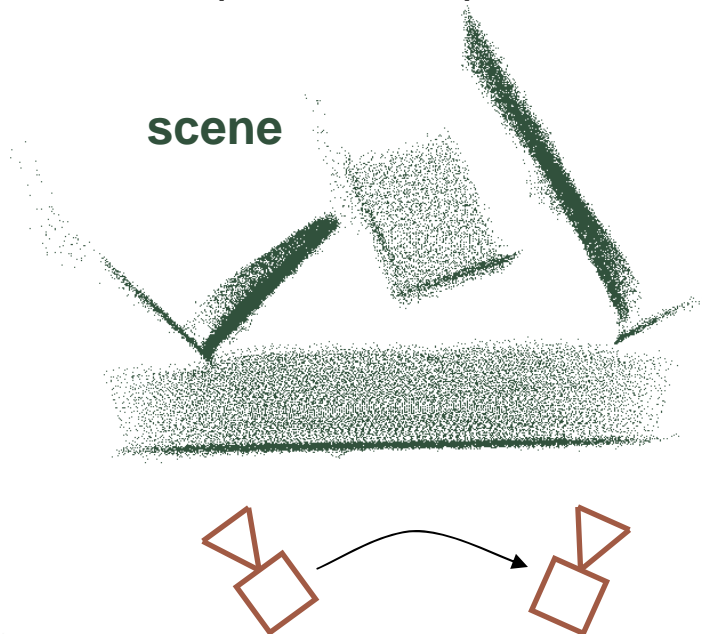

Results – Impact of Filtering and Calibration II

- Simple trajectory: 400 mm in x-direction
- Translational error is reduced by > 50 % from 150 mm to 40 mm
- Rotational error is reduced by > 50 % from 3 ° to 1 °

Results – Impact of Filtering and Calibration III

- Simple trajectory: Rotation at z-axis of robot-tcp by 50 degrees
- Translational error is reduced, but is nearly 100 % of the covered distance
- Errors are significantly larger compared with previous experiments

Light Scattering and Multipath Interference

- Again: Rotation at robot-tcp-z by 50°
- Highly reflective object was replaced
- Comparison of distance images with images from previous experiment
- Difference images display the distortions by *Light Scattering and Multipath Interference*

depth image

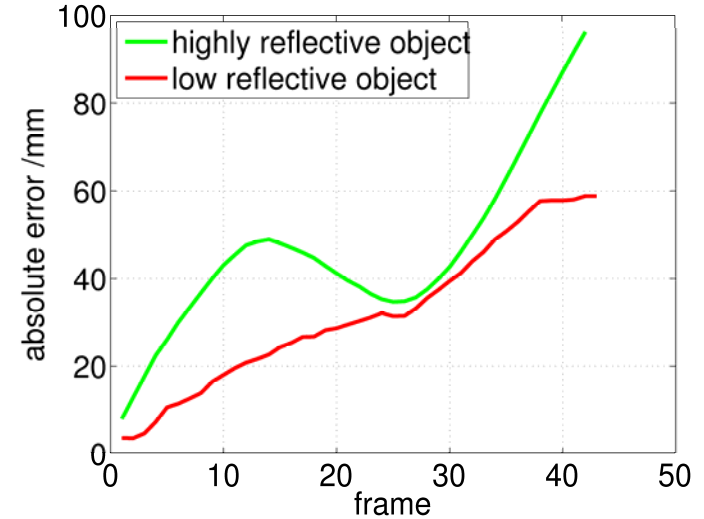

difference image

Light Scattering and Multipath Interference

- Due to the low reflective object: Decrease of translational and rotational error
- Multiple reflections and scattering nearly double the error!

Experimental Results – Evaluation Setup

- Styrofoam objects assembled in square measuring 1.8 m
- Circumferentially captured the scene with 180 images
- Circular trajectory with a diameter of 300 mm (path length 950 mm)

Experimental Results – Laboratory Scene

- Error before loop closure: 150 mm / 6°
- Isometry: Deviations of 35 mm and 20 mm

Especially first part of trajectory is affected by multipath reflections

raw map

globally relaxed error

Experimental Results – Larger Environment

- Ambiguities
- Longest distance ≈ 19 m
- Spurious, noisy measurements
- Path length ≈ 10 m
- Error in Ego motion estimation:
 1.7 m / 9°
- Error in isometry:
 0.4 m

Experimental Results – Larger Environment

Contributions

- Robust 3d mapping with ToF cameras
- Promising results in spite of erroneous data, due to
 - Calibration
 - Filtering
 - ICP Optimization
- Identified remaining crucial influences
- Provide the data for further investigations
